

Current-Shunt Monitors, Zero-Drift, 40 V Common Mode, Bidirectional, Shutdown

NCS21671, NCV21671

The NCS21671 and NCV21671 are a series of voltage output current sense amplifiers offered in gains of 25, 50, 100, and 200 V/V. These parts can measure voltage across shunts at common mode voltages from -0.1 V to 40 V, independent of supply voltage. The low offset of the zero-drift architecture enables current sensing with voltage drops across sense resistors as low as 10 mV full-scale. An optional enable function is available to reduce current drain through the input pins and power supply pins to negligible levels when disabled or if V_S is less than 1.5 V. Two optional pins are included to simplify input filtering. These devices can operate from a single +1.8 V to +5.5 V power supply, drawing a maximum of 80 μ A of supply current. These parts are available in Micro10 and SC70-6 packages.

Features

- Wide Common Mode Input Range: -0.1 V to 40 V
- Supply Voltage Range: 1.8 V to 5.5 V
- Low Offset Voltage: $\pm 25 \mu$ V max
- Rail-to-Rail Output Capability
- Low Current Consumption: 80 μ A max
- Enable Pin to Turn Off Input and Power Supply Currents
- Optional Input Filtering Through C_{IN+} and C_{IN-} Pins
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications

- Power Bus Monitoring
- Battery Current Monitor
- Lighting Ballast

Figure 1. Example Application Schematic of High-Side Current Sensing

PIN FUNCTION DESCRIPTION

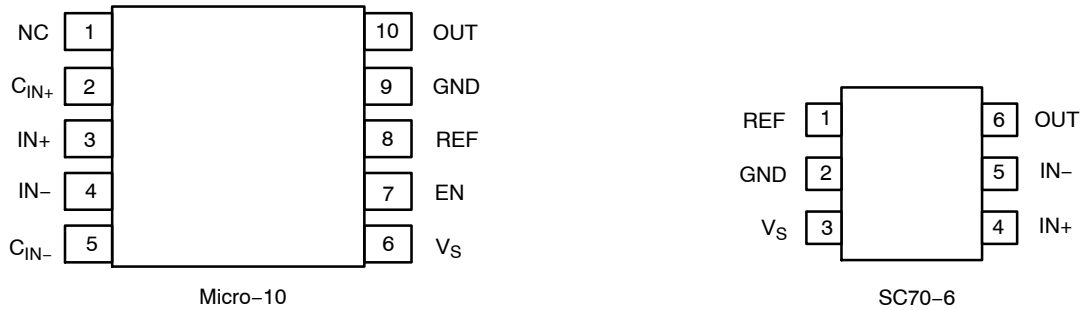

Figure 2. Pin Function Description

PIN DESCRIPTION

Pin Name	Type	Description
NC	No connect	This pin must be left not connected to external circuitry.
C _{IN+}	Input	<i>Available on Micro10 packages only.</i> An optional capacitor can be added between C _{IN+} and C _{IN-} to create a low-pass input filter.
IN+	Input	This pin is connected to the positive side of the sense resistor or current shunt. This pin becomes high impedance when the part is in shutdown mode (EN = 0).
IN-	Input	This pin is connected to the negative side of the sense resistor or current shunt. This pin becomes high impedance when the part is in shutdown mode (EN = 0).
C _{IN-}	Input	<i>Available on Micro10 packages only.</i> An optional capacitor can be added between C _{IN+} and C _{IN-} to create a low-pass input filter.
V _S	Supply	This is the positive supply pin that provides power to the internal circuitry. An external bypass capacitor of 0.1 μF is recommended to be placed as close as possible to this pin.
EN	Input	<i>Available on Micro10 packages only.</i> There is no pull-up enable the part when this pin is open circuit. The enable pin can be connected to V _S or driven with a logic level to enable the part. If this pin is driven low the part enters a low power mode to conserve current consumption.
REF	Input	This pin sets the reference voltage of the internal difference amplifier circuit, allowing for unidirectional or bidirectional current sensing. For unidirectional current sensing, connect this pin to GND. For bidirectional current sensing, connect this pin between the GND and V _S range.
GND	Supply	This is the negative supply rail of the circuit.
OUT	Output	The output pin provides a low impedance voltage output. This pin becomes high impedance when the part is in shutdown mode (EN = 0).

MAXIMUM RATINGS

Parameter		Symbol	Rating	Unit
Supply Voltage (Note 1)		V_S	-0.3 to 6	V
IN+, IN-, CIN+, CIN-	Differential ($V_{IN+} - V_{IN-}$) (Note 2)	V_{IN+}, V_{IN-}	44	V
	Common-Mode (Note 2)		-0.3 to +44	
REF Input		V_{REF}	GND-0.3 to (V_S) +0.3	V
EN Input		V_{EN}	GND-0.3 to (V_S) +0.3	V
Output (Note 2)		V_{OUT}	GND-0.3 to (V_S) +0.3	V
Input Current into Any Pin (Note 2)		I_{IN}	± 10	mA
Operating Temperature		T_A	-40 to +150	$^{\circ}\text{C}$
Storage Temperature		T_{STG}	-65 to +150	$^{\circ}\text{C}$
Junction Temperature		$T_{J(max)}$	+150	$^{\circ}\text{C}$
ESD Capability, Human Body Model (Note 3)		HBM	± 2000	V
Charged Device Model (Note 3)		CDM	± 1000	V
Latch-up Current (Note 4)			± 100	mA

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS, RECOMMENDED OPERATING RANGES and/or APPLICATION INFORMATION for safe operating parameters.
2. Input voltage at any pin may exceed the voltage shown if current at that pin is limited to ± 10 mA.
3. This device series incorporates ESD protection and is tested by the following methods:
 ESD Human Body Model tested per JEDEC standard JS-001-2017
 ESD Charged Device Model tested per JEDEC standard JS-002-2014
4. Latch-up Current tested per JEDEC standard JESD78E

THERMAL CHARACTERISTICS

Parameter	Symbol	Micro10 / MSOP10	SC88 / SC70-6 / SOT-363	Unit
Junction-to-ambient thermal resistance (Notes 5, 6)	θ_{JA}	180	188	$^{\circ}\text{C}/\text{W}$
Junction-to-case thermal resistance (Notes 5, 6)	$\theta_{JC(top)}$	71	128	$^{\circ}\text{C}/\text{W}$
Junction-to-top thermal characterization (Notes 5, 6)	Ψ_{JT}	1.6	21	$^{\circ}\text{C}/\text{W}$
Junction-to-board thermal characterization (Notes 5, 6)	Ψ_{JB}	98	91	$^{\circ}\text{C}/\text{W}$

5. Refer to ELECTRICAL CHARACTERISTICS, RECOMMENDED OPERATING RANGES and/or APPLICATION INFORMATION for safe operating parameters.
6. Values based on copper area of 645 mm² (or 1 in²) of 1 oz copper thickness and FR4 PCB substrate. (reference JESD51).

RECOMMENDED OPERATING RANGES

Parameter	Symbol	Conditions	Min	Max	Unit
Operating Temperature	T_A	NCS prefix	-40	125	$^{\circ}\text{C}$
		NCV prefix	-40	125	
Common Mode Input Voltage	V_{CM}	Full temperature range	-0.1	40	V
Supply Voltage	V_S	Full temperature range	1.8	5.5	V

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

APPLICATION INFORMATION

Current Sensing Techniques

The NCS21671 and NCV21671 are current sense amplifiers featuring a wide common mode voltage range that spans from -0.1 V to 40 V independent of the supply voltage. These amplifiers can be configured for low-side and high-side current sensing.

At first glance, low-side sensing appears to have the advantage of being straightforward, inexpensive, and the ability to be implemented with a simple op amp circuit. However, the NCS21671 provides the full differential input necessary to get accurate shunt connections while also providing a built-in gain network with precision difficult to obtain with external resistors.

While at times the application requires low-side sensing, only high-side sensing can detect a short from the positive supply line to ground. Furthermore, high-side sensing avoids adding resistance to the ground path of the load being measured.

Bidirectional Operation

The NCS21671 can be configured to monitor unidirectional or bidirectional current flow.

In unidirectional current sensing, the measured load current always flows in the same direction. Common applications for unidirectional operation include power supplies and load current monitoring. The NCS21671 can be set up for unidirectional monitoring by connecting the REF pin to ground. In this configuration, the IN+ pin should be connected to the high side of the sense resistor, while the IN- pin should be connected to the low side of the sense resistor.

Bidirectional current sensing measures current flow in both directions. A common application for bidirectional current sensing is battery monitoring. While the battery is charging, current flows in one direction; while the battery is being used, current flows in the other direction. For bidirectional current flow, the REF pin can be connected to a voltage between GND and the Vs supply. Typically, the REF

pin is connected to the mid-supply voltage for bidirectional monitoring.

Enable Pin

The enable pin can be used to shut down the part and reduce current consumption. When the part is shut down, quiescent current drops to less than $1\text{ }\mu\text{A}$ and the inputs become high impedance. The output also becomes high impedance in the shutdown mode.

Input Filtering

Some applications may require filtering at the input of the current sense amplifier. Input filtering is simplified with the CIN+ and CIN- pins. Simply add an external capacitor across the pins to set the cutoff frequency, f_c .

$$f_c = \frac{1}{2\pi(2R_{\text{filt}})C_{\text{filt}}} \quad (\text{eq. 1})$$

Table 1. Internal Resistance Values

Gain (V/V)	R_{filt} (k Ω)	R_{in} (k Ω)	R_{fb} (M Ω)
25	20	20	1
50	10	10	1
100	5	5	1
200	2.5	2.5	1

The internal filter resistance has a tolerance of $\pm 25\%$.

If the filtering capacitor is not used, Cin+ and Cin- pins should be left floating.

As shunt resistors decrease in value, shunt inductance can significantly affect frequency response. At values below $1\text{ m}\Omega$, the shunt inductance causes a zero in the transfer function that often results in corner frequencies in the low 100's of kHz. This inductance increases the amplitude of high frequency spike transient events on the current sensing

NCS21671, NCV21671

line that can overload the front end of any shunt current sensing IC.

This problem must be solved by filtering at the input of the amplifier. Note that all current sensing ICs are vulnerable to this problem, regardless of manufacturer claims. Filtering is required at the input of the device to resolve this problem, even if the spike frequencies are above the rated bandwidth of the device.

Ideally, select the capacitor to exactly match the time constant of the shunt resistor and its inductance; alternatively, select the capacitor to provide a pole below that point. Make the input filter time constant equal to or larger than the shunt and its inductance time constant:

$$\frac{L_{SHUNT}}{R_{SHUNT}} \leq R_{FILT} C_{FILT} \quad (\text{eq. 2})$$

Selecting the Shunt Resistor

The desired accuracy of the current measurement determines the precision, shunt size, and the resistor value. The larger the resistor value, the more accurate the measurement possible, but a large resistor value also results in greater current loss.

For the most accurate measurements, use four terminal current sense resistors. It provides two terminals for the current path in the application circuit, and a second pair for the voltage detection path of the sense amplifier. This technique is also known as *Kelvin Sensing*. This ensures that the voltage measured by the sense amplifier is the actual voltage across the resistor and does not include the small resistance of a combined connection. When using non-Kelvin shunts, follow manufacturer recommendations on how to lay out the sensing traces closely.

Gain Options

The gain is set by integrated, precision, ratio-matched resistors. The NCS21671 is available in gain options of 25 V/V, 50 V/V, 100 V/V, and 200 V/V. Adding external resistors to adjust the gain can contribute to the overall system error and is not recommended.

$$P_D \approx V_{in}(I_{GND}@I_{out}) + I_{out}(V_{in} - V_{out}) \quad (\text{eq. 3})$$

$$V_{in(MAX)} \approx \frac{P_{D(MAX)} + (V_{out} \cdot I_{out})}{I_{out} + I_{GND}} \quad (\text{eq. 4})$$

 2. CONTROLLING DIMENSION: MILLIMETERS.
 3. DIMENSIONS D AND E1 DO NOT INCLUDE MOLD FLASH, PROTRUSIONS, OR GATE BURRS. MOLD FLASH, PROTRUSIONS, OR GATE BURRS SHALL NOT EXCEED 0.20 PER END.
 4. DIMENSIONS D AND E1 AT THE OUTERMOST EXTREMES OF THE PLASTIC BODY AND DATUM H.
 5. DATUMS A AND B ARE DETERMINED AT DATUM H.
 6. DIMENSIONS b AND c APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.08 AND 0.15 FROM THE TIP.
 7. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08 TOTAL IN EXCESS OF DIMENSION b AT MAXIMUM MATERIAL CONDITION. THE DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OF THE FOOT.

DIM	MILLIMETERS			INCHES		
	MIN	NOM	MAX	MIN	NOM	MAX
A	---	---	1.10	---	---	0.043

GENERIC MARKING DIAGRAM*

XXX = Specific Device Code
 M = Date Code*
 ▪ = Pb-Free Package

(Note: Microdot may be in either location)

*Date Code orientation and/or position may vary depending upon manufacturing location.

*This information is generic. Please refer to device data sheet for actual part marking. Pb-Free indicator, "G" or microdot "▪", may or may not be present. Some products may not follow the Generic Marking.

RECOMMENDED SOLDERING FOOTPRINT*

*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.
