

LDO Regulator, Ultra Low I_q , with Enable and Reset, 350 mA

NCV8772C

The NCV8772C is 350 mA LDO regulator with integrated reset function dedicated for microprocessor applications. Its robustness allows NCV8772C to be used in severe automotive environments. Ultra low quiescent current as low as 18 μA typical makes it suitable for applications permanently connected to battery requiring ultra low quiescent current with or without load. This feature is especially critical when modules remain in active mode when ignition is off. The Enable function can be used for further decrease of quiescent current in shutdown mode to 1 μA . The NCV8772C contains protection functions as current limit, thermal shutdown and reverse output current protection.

Features

- Output Voltage Options: 3.3 V and 5 V
- Output Voltage Accuracy: $\pm 2\%$
- Output Current up to 350 mA
- Ultra Low Quiescent Current: typ 18 μA (max 24 μA)
- Very Wide Range of C_{out} and ESR Values for Stability
- Enable Function
 - 1 μA Max Quiescent Current when disabled
- Wide Input Voltage Operation Range: up to 40 V
- Protection Features
 - Current Limitation
 - Thermal Shutdown
 - Reverse Output Current Protection
- EMC Compliant
- AEC-Q100 Grade 1 Qualified and PPAP Capable
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- Body Control Module
- Instruments and Clusters
- Occupant Protection and Comfort
- Powertrain

PIN CONNECTIONS

Figure 3. Pin Connections

PIN FUNCTION DESCRIPTION

Pin No. DPAK-5 D2PAK-5	Pin Name	Description
1	V _{in}	Positive Power Supply Input. Connect 0.1 μF capacitor to ground.
2	RO	Reset Output. 30 kΩ internal Pull-up resistor (5 V option only) connected to V _{out} . RO goes Low when V _{out} drops by more than 7% from its nominal value (for NCV8772Cy devices with y = 0,1,2,...).
3, TAB	GND	Power Supply Ground.
4	EN	Enable Input. Low level disables the IC.
5	V _{out}	Regulated Output Voltage. Connect 1 μF capacitor with ESR < 5 Ω to ground.

ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Min	Max	Unit
Input Voltage DC	V_{in}	-0.3	40	V
Input Voltage (Note 1) Load Dump – Suppressed	V_{S*}	-	45	
Output Voltage (Note 2)	V_{out}	-0.3	7	V
Enable Input Voltage	V_{EN}	-0.3	40	V
Reset Output Voltage	V_{RO}	-0.3	7.0	V
Junction Temperature Range	T_J	-40	150	°C
Storage Temperature Range	T_{STG}	-55	150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Load Dump Test B (with centralized load dump suppression) according to ISO16750 – 2 standard. Guaranteed by design. Not tested in production. Passed Class C according to ISO16750 – 1.
2. 5.5 V or ($V_{in} + 0.3$ V) (whichever is lower).

ESD CAPABILITY (Note 3)

Rating	Symbol	Min	Max	Unit
ESD Capability, Human Body Model	ESD_{HBM}	-4	4	kV
ESD Capability, Charged Device Model	ESD_{CDM}	-1	1	kV

3. This device series incorporates ESD protection and is tested by the following methods:
 ESD Human Body Model tested per AEC-Q100-002 (JS-001-2017)
 Field Induced Charge Device Model ESD characterization is not performed on plastic molded packages with body sizes smaller than 2 x 2 mm due to the inability of a small package body to acquire and retain enough charge to meet the minimum CDM discharge current waveform characteristic defined in JEDEC JS-002-2018

LEAD SOLDERING TEMPERATURE AND MSL (Note 4)

Rating	Symbol	Min	Max	Unit
Moisture Sensitivity Level DPAK-5 D2PAK-5	MSL		1 1	-

DEFINITIONS

General

All measurements are performed using short pulse low duty cycle techniques to maintain junction temperature as close as possible to ambient temperature.

Output voltage

The output voltage parameter is defined for specific temperature, input voltage and output current values or specified over Line, Load and Temperature ranges.

Line Regulation

The change in output voltage for a change in input voltage measured for specific output current over operating ambient temperature range.

Load Regulation

The change in output voltage for a change in output current measured for specific input voltage over operating ambient temperature range.

Dropout Voltage

The input to output differential at which the regulator output no longer maintains regulation against further reductions in input voltage. It is measured when the output drops 100 mV below its nominal value. The junction temperature, load current, and minimum input supply requirements affect the dropout level.

Quiescent and Disable Currents

Quiescent Current (I_q) is the difference between the input current (measured through the LDO input pin) and the output load current. If Enable pin is set to LOW the regulator reduces its internal bias and shuts off the output, this term is called the disable current (I_{DIS}).

Current Limit and Short Circuit Current Limit

Current Limit is value of output current by which output voltage drops below 96% of its nominal value. Short Circuit Current Limit is output current value measured with output of the regulator shorted to ground.

PSRR

Power Supply Rejection Ratio is defined as ratio of output voltage and input voltage ripple. It is measured in decibels (dB).

Line Transient Response

Typical output voltage overshoot and undershoot response when the input voltage is excited with a given slope.

Load Transient Response

Typical output voltage overshoot and undershoot response when the output current is excited with a given slope between low-load and high-load conditions.

Thermal Protection

Internal thermal shutdown circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When activated at typically 175°C, the regulator turns off. This feature is provided to prevent failures from accidental overheating.

Maximum Package Power Dissipation

The power dissipation level is maximum allowed power dissipation for particular package or power dissipation at which the junction temperature reaches its maximum operating value, whichever is lower.

APPLICATIONS INFORMATION

The NCV8772C regulator is self-protected with internal thermal shutdown and internal current limit. Typical characteristics are shown in Figure 4 to Figure 30.

Input Decoupling (C_{in})

A ceramic or tantalum 0.1 μF capacitor is recommended and should be connected close to the NCV8772C package. Higher capacitance and lower ESR will improve the overall line and load transient response.

If extremely fast input voltage transients are expected then appropriate input filter must be used in order to decrease rising and/or falling edges below 50 V/μs for proper operation. The filter can be composed of several capacitors in parallel.

Output Decoupling (C_{out})

The NCV8772C is a stable component and does not require a minimum Equivalent Series Resistance (ESR) for the output capacitor. Stability region of ESR vs Output Current is shown in Figure 25. The minimum output decoupling value is 1 μF and can be augmented to fulfill stringent load transient requirements. The regulator works with ceramic chip capacitors as well as tantalum devices. Larger values improve noise rejection and load regulation transient response.

Enable Operation

The Enable pin will turn the regulator on or off. The threshold limits are covered in the electrical characteristics table in this datasheet.

Reset Operation

A reset signal is provided on the Reset Output (RO) pin to provide feedback to the microprocessor of an out of regulation condition. The timing diagram of reset function is shown in Figure 31. This is in the form of a logic signal on RO. Output voltage conditions below the RESET threshold cause RO to go low. The RO integrity is maintained down to V_{out} = 1.0 V. For 5 V voltage option, the Reset Output (RO) circuitry includes internal pull-up (30 kΩ) connected to the output (V_{out}) No external pull-up is necessary. For voltage options and 3.3 V RO is open drain output and external pull-up resistor is required. Select pull-up resistor in range between 5 kΩ to 100 kΩ with respect to I_{ROmax} and I_{ROLK} limits to keep V_{RO} logic levels at appropriate range.

Reset signal is also generated in case when input voltage decreases below its minimum operating limit (4.5 V). The Input Voltage Reset Threshold is typically 3.8 V.

RESET DELAY AND RESET THRESHOLD OPTIONS (DPAK-5 AND D2PAK-5)

	Reset Delay Time	Reset Threshold
NCV8772CDTxx0 NCV8772CDSxx0	0 ms	93%
NCV8772CDTxx1 NCV8772CDSxx1	2 ms	93%
NCV8772CDTxx2 NCV8772CDSxx2	4 ms	93%
NCV8772CDTxx3 NCV8772CDSxx3	8 ms	93%
NCV8772CDTxx4 NCV8772CDSxx4	16 ms	93%
NCV8772CDTxx5 NCV8772CDSxx5	32 ms	93%
NCV8772CDTxx6 NCV8772CDSxx6	64 ms	93%
NCV8772CDTxx7 NCV8772CDSxx7	128 ms	93%

NOTE: The timing values can be selected from the following list: 0, 2, 4, 8, 16, 32, 64, 128 ms. Contact factory for options not included in ORDERING INFORMATION table on page 13.

Thermal Considerations

As power in the NCV8772C increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. When the NCV8772C has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power applications. The maximum dissipation the NCV8772C can handle is given by:

$$P_{D(max)} = \frac{[T_{J(max)} - T_A]}{R_{\theta JA}} \quad (eq. 1)$$

Since T_J is not recommended to exceed 150°C, then the NCV8772C soldered on 645 mm², 1 oz copper area, FR4 can dissipate up to 2.95 W (for D2PAK-5) when the ambient temperature (T_A) is 25°C. See Figure 32 for R_{θJA} versus PCB area. The power dissipated by the NCV8772C can be calculated from the following equations:

$$P_D = V_{in}(I_q@I_{out}) + I_{out}(V_{in} - V_{out}) \quad (eq. 2)$$

or

$$V_{in(max)} = \frac{P_{D(max)} + (V_{out} \times I_{out})}{I_{out} + I_q} \quad (eq. 3)$$

NOTE: Items containing I_q can be neglected if I_{out} >> I_q.

NCV8772C

Figure 32. Thermal Resistance vs. PCB Copper Area (D2PAK-5)

Figure 33. Thermal Resistance vs. PCB Copper Area (DPAK-5)

Hints

V_{in} and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance to pick up noise or cause the regulator to malfunction. Place external components, especially the output capacitor, as close as possible to the NCV8772C and make traces as short as possible.

The NCV8772C is not developed in compliance with ISO26262 standard. If application is safety critical then the below application diagram shown in Figure 34 can be used.

Figure 34. Application Diagram

All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. ON Semiconductor does not convey any license under its patent rights nor the rights of others. ON Semiconductor products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use ON Semiconductor products for any such unintended or unauthorized application, Buyer shall indemnify and hold ON Semiconductor and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that ON Semiconductor was negligent regarding the design or manufacture of the part. ON Semiconductor is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
