

Features

Power Module

- High power density (L*W*H = 12.19*12.19*3.75)
- Wide operating temperature -40°C to +105°C at full load
- Efficiency up to 98%, no need for heatsinks
- 6-sided shielding
- Thermally and EMI enhanced 25 pad LGA package
- Compact DOSA-compatible footprint
- Low profile

RPM-2.0

2 Amp Single Output

EN55032 compliant

Description

The RPM-2.0 series is a 2A non-isolated switching regulator power module with a full set of features including adjustable output, sequencing, soft-start control, on/off control, and power good signals. The ultra-compact module has a profile of only 3.75mm, but with an efficiency of up to 98%, the device can operate at full load in ambient temperatures as high as +105°C without forced air cooling. The package is complete with 6-sided shielding for optimal EMC performance and excellent heat management.

OUTPUT VOLTAGE TRIMMING

The RPM series offers the feature of trimming the output voltage over a range between 0.9V and 6V by using external trim resistors. The values for trim resistors shown in trim tables below are according to standard E96 values; therefore, the specified voltage may slightly vary.

- V_{out_nom} = nominal output voltage [VDC]
- V_{out_set} = trimmed output voltage [VDC]
- V_{ref} = reference voltage [VDC]
- R_{up} = trim up resistor [Ω]
- R_{down} = trim down resistor [Ω]
- R_1, R_2, R_3 = internal resistors [Ω]

| V_{out_nom} | R_1 | R_2 | R_3 | V_{ref} |
|----------------|---------------|-------------|---------------|-----------|
| 3.3VDC | 376k Ω | 1k Ω | 471k Ω | 0.81VDC |
| 5VDC | 344k Ω | | 431k Ω | |

Calculation:

$$R_{up} = \left[\frac{R_1}{V_{out_set} - V_{nom}} \right] - R_2$$

$$R_{down} = \left[\frac{(V_{out_set} - V_{ref}) \times R_3}{V_{out_nom} - V_{out_set}} \right]$$

Practical Example RPM3.3-2.0:

$$R_{up} = \left[\frac{376k}{4.3 - 3.3} \right] - 1k = \underline{\underline{375k\Omega}}$$

$$R_{down} = \left[\frac{(1.8 - 0.81) \times 471k}{3.3 - 1.8} \right] = \underline{\underline{311k\Omega}}$$

R_{up} according to E96 \approx 374k Ω

R_{down} according to E96 \approx 309k Ω

REMOTE SENSE

The output voltage can be adjusted via the trim and sense functions.

The maximum output voltage from Trim and Sense function combined is 5.5VDC. Derating may be required when using Trim and/or sense functions.

Sequencing Multiple Modules

The SEQ pin can be used to program the rising edge of the output voltage. An internal current source charges a soft-start capacitor which is connected from the sequencing pin to GND. The following equation is used to calculate the soft-start capacitor:

C_{ss} = soft-start capacitor

I_{ss} = sum of all soft-start currents of all sequenced modules

t_{ss} = required soft-start time

n = number of RPMs

$$C_{ss} = \frac{t_{ss} \times I_{ss}}{1.25V} - n \times 3.3nF$$

Note: there is a 3.3nF internal soft-start capacitor, and there are different constant current sources in the modules which leads to different preset soft-start times.

To sequence multiple power module start-up times the power good (PGood) pin and the CTRL pin may be used. In below schematic, the RPM(n) starts after RPM(1) reaches its set output voltage and the power good signal is set to high which then enables RPM(n). After RPM(n) reaches its set output voltage, it enables RPM(n+1).

To sequence multiple converters to start at the same time (set output voltage is reached at the same time), the following schematic may be used:
